Cluster and Calendar based Visualization of Time Series Data.

Jarke J. van Wijk and Edward R. van Selow. Proc. InfoVis 1999, p 4-9.

Research question:

How to create visual insights into univariate time series data?

*office building
(ECN)*

e.g., energy
consumption

time

Design No. 1

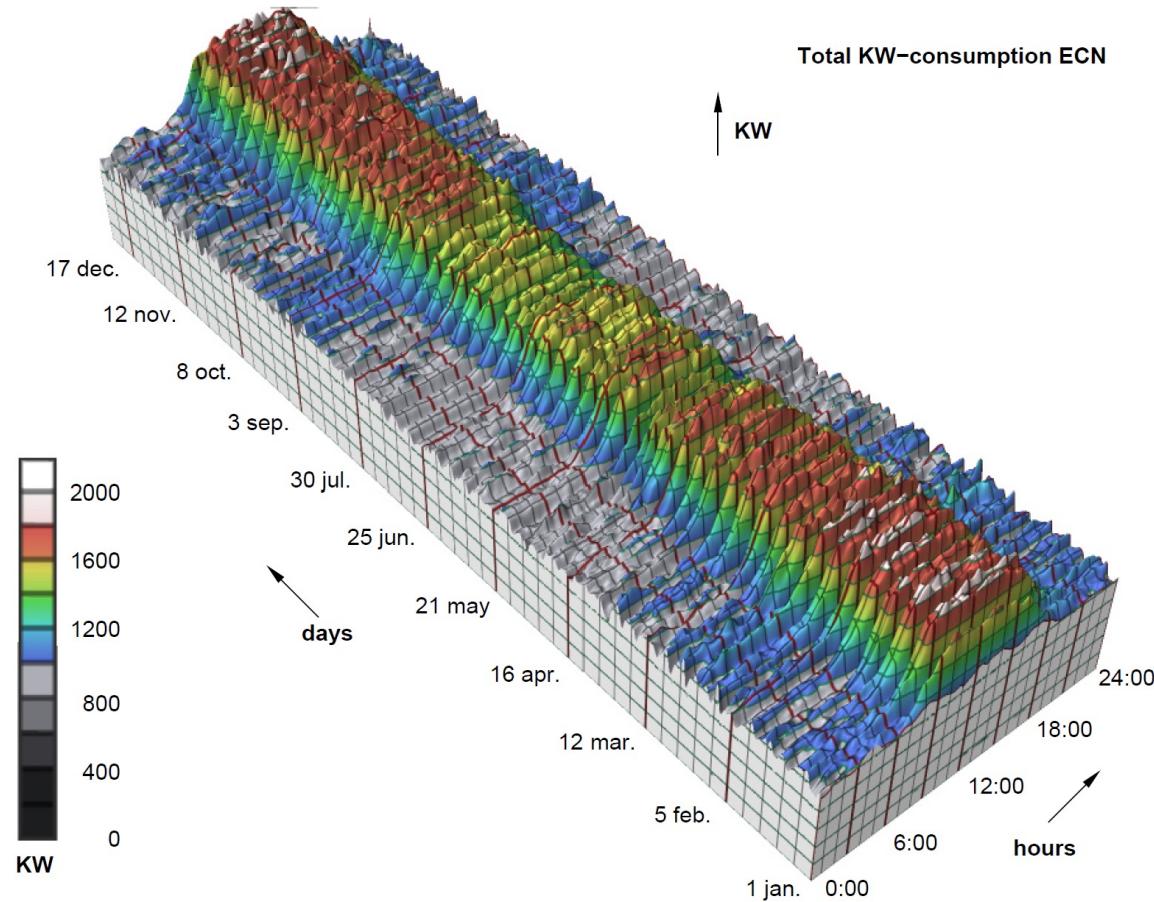

Figure 1: Power demand by ECN, displayed as a function of hours and days

Design No. 2

Several conclusions can be drawn from this image. We see that:

- Office hours are followed strictly. Most people arrive between 8:30 and 9:00 am, and leave between 4:00 and 5:00 pm. Furthermore, in the morning the number of employees present is slightly higher than in the afternoon.
- On Fridays and in the summer fewer people are present (cluster 722);
- On Fridays in the summer even fewer people are present (cluster 718);
- In the weekend and at holidays only very few people are working (cluster 710): security and fire brigade;
- Holidays in the Netherlands in 1997 were January 1st, March 28th, March 31st, April 30th, May 5th, May 8th, May 19th, December 25th and 26th.
- School vacations are visible in Spring (May 3rd to May 11th), in Autumn (October 11th to October 19th), and in Winter (December 21st to December 31st);
- Many people take a day off after a holiday (cluster 721);
- On December 5th many people left at 4:00 PM. Dutch people will immediately know the explanation: On this day we celebrate Santa Claus and are allowed to leave earlier!

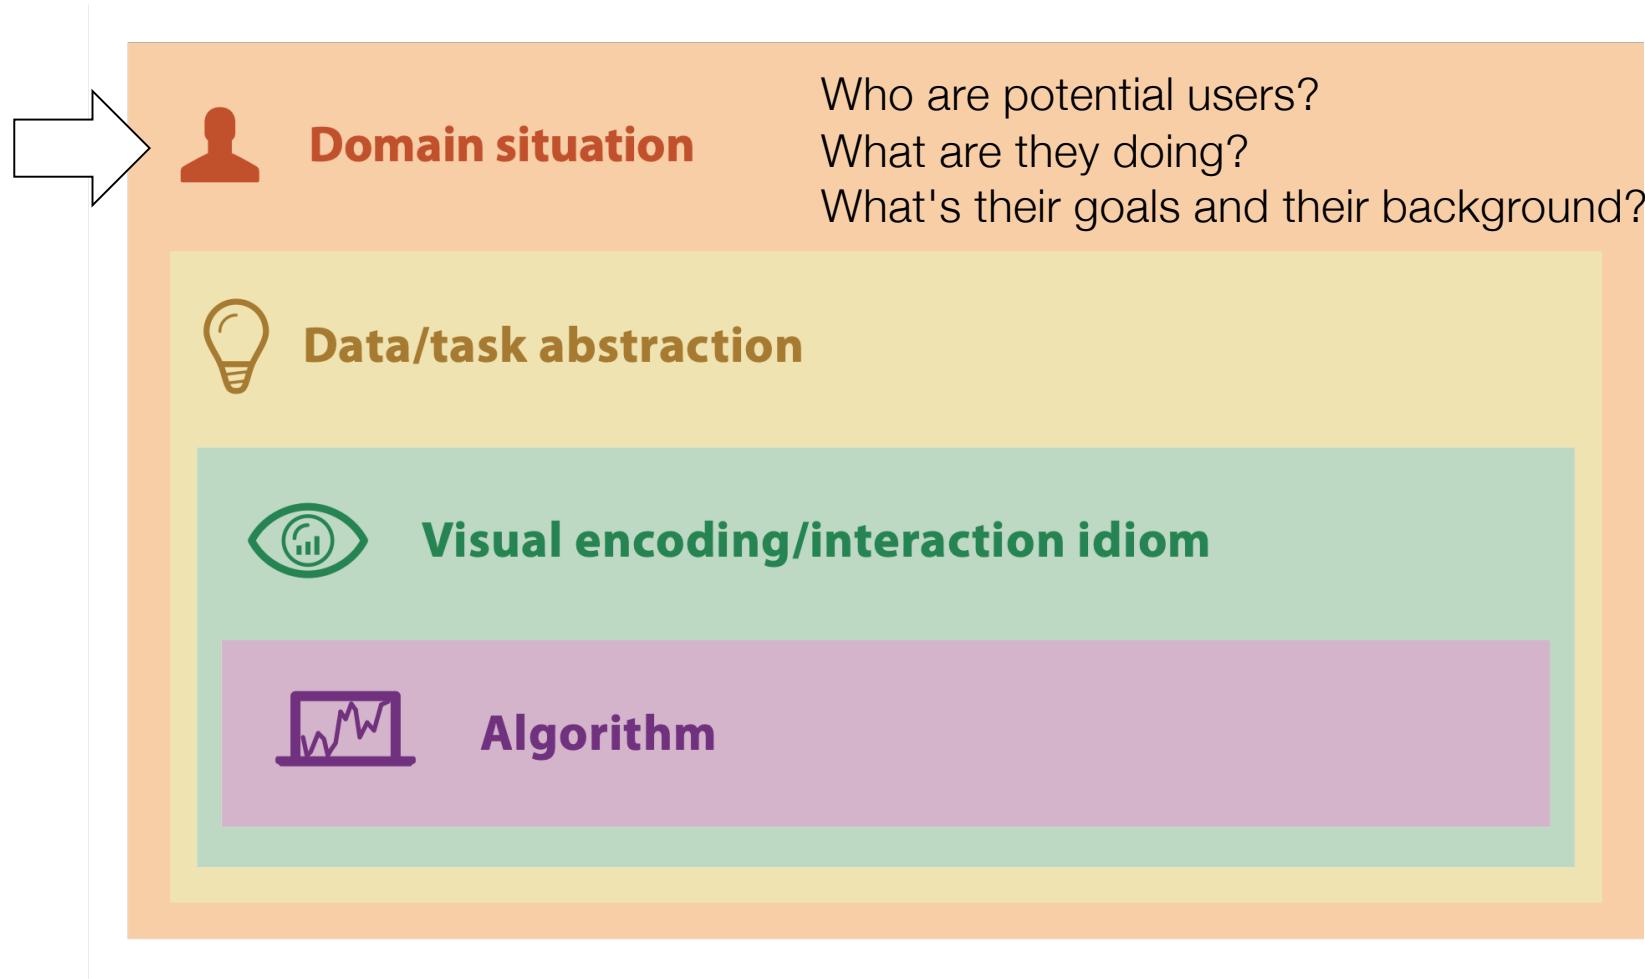

Nested model for visualization design

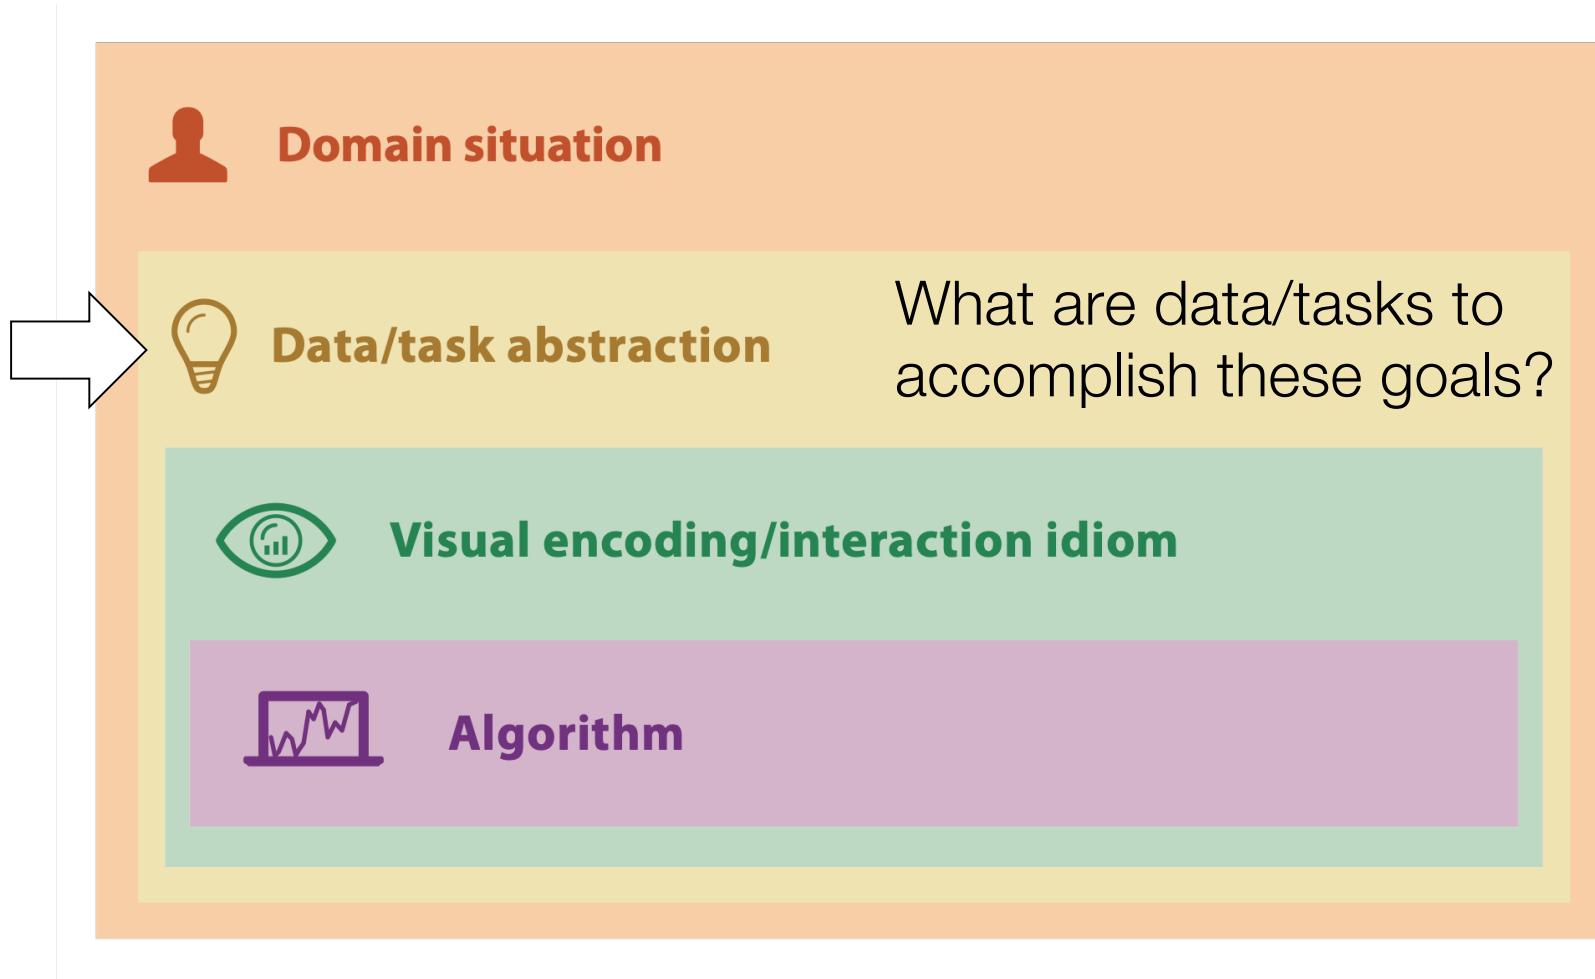

Nested model for vis design (Munzner 2009, 2014)

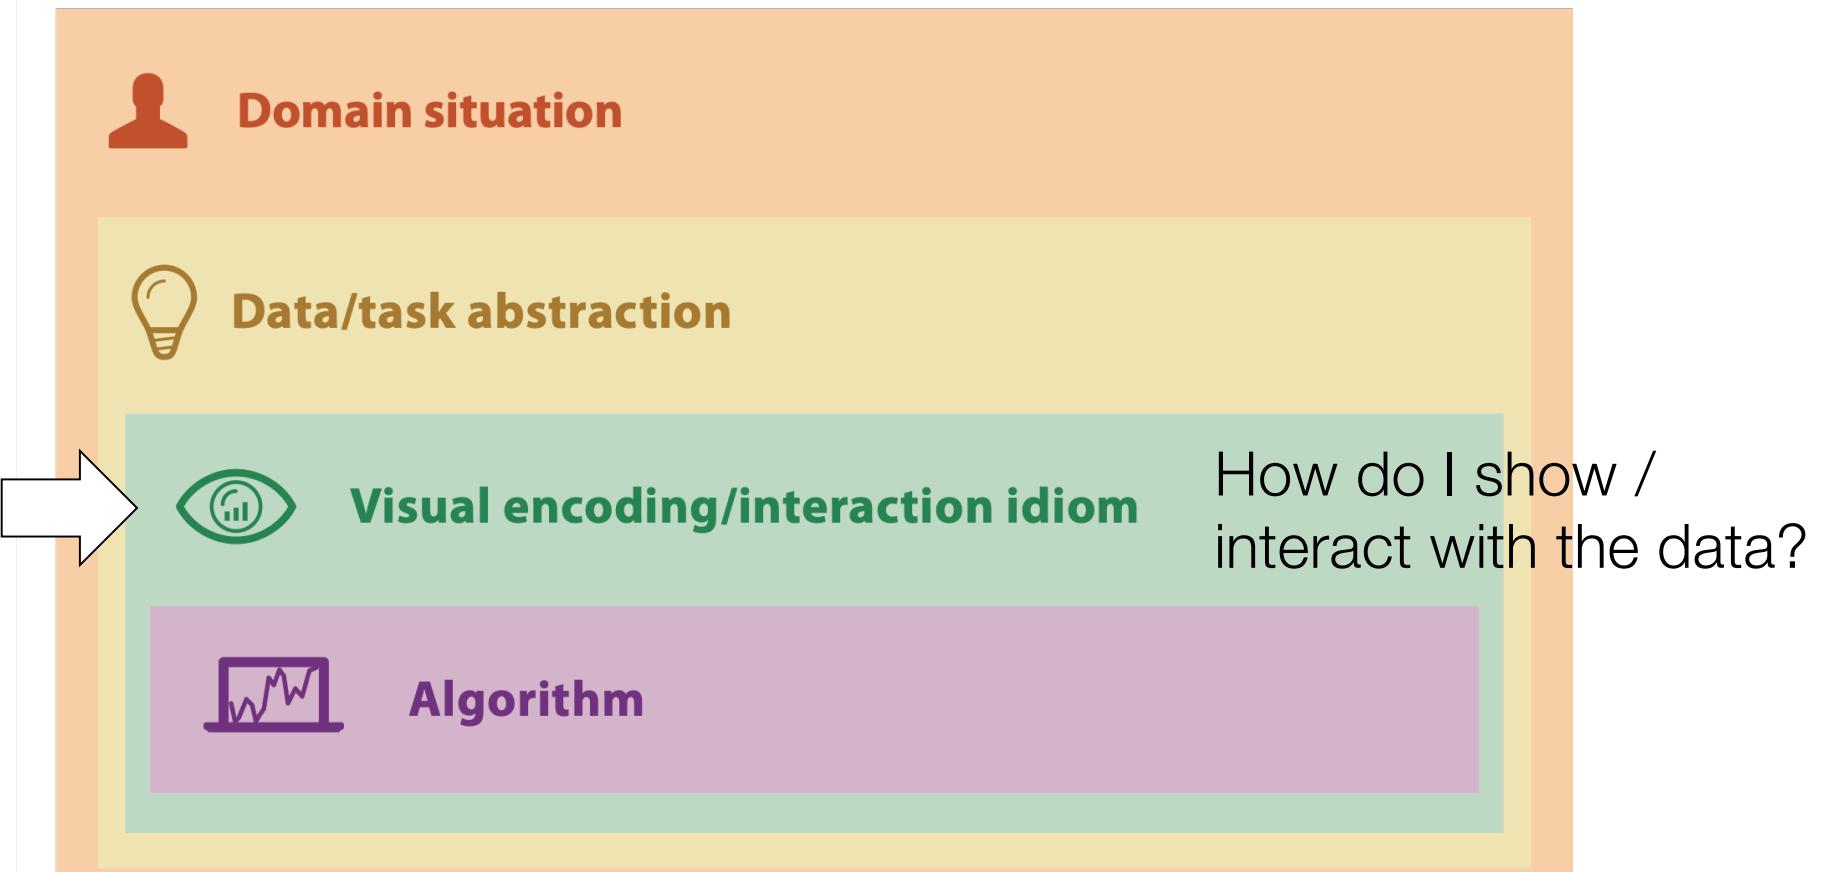

a) Analyzing the domain problem

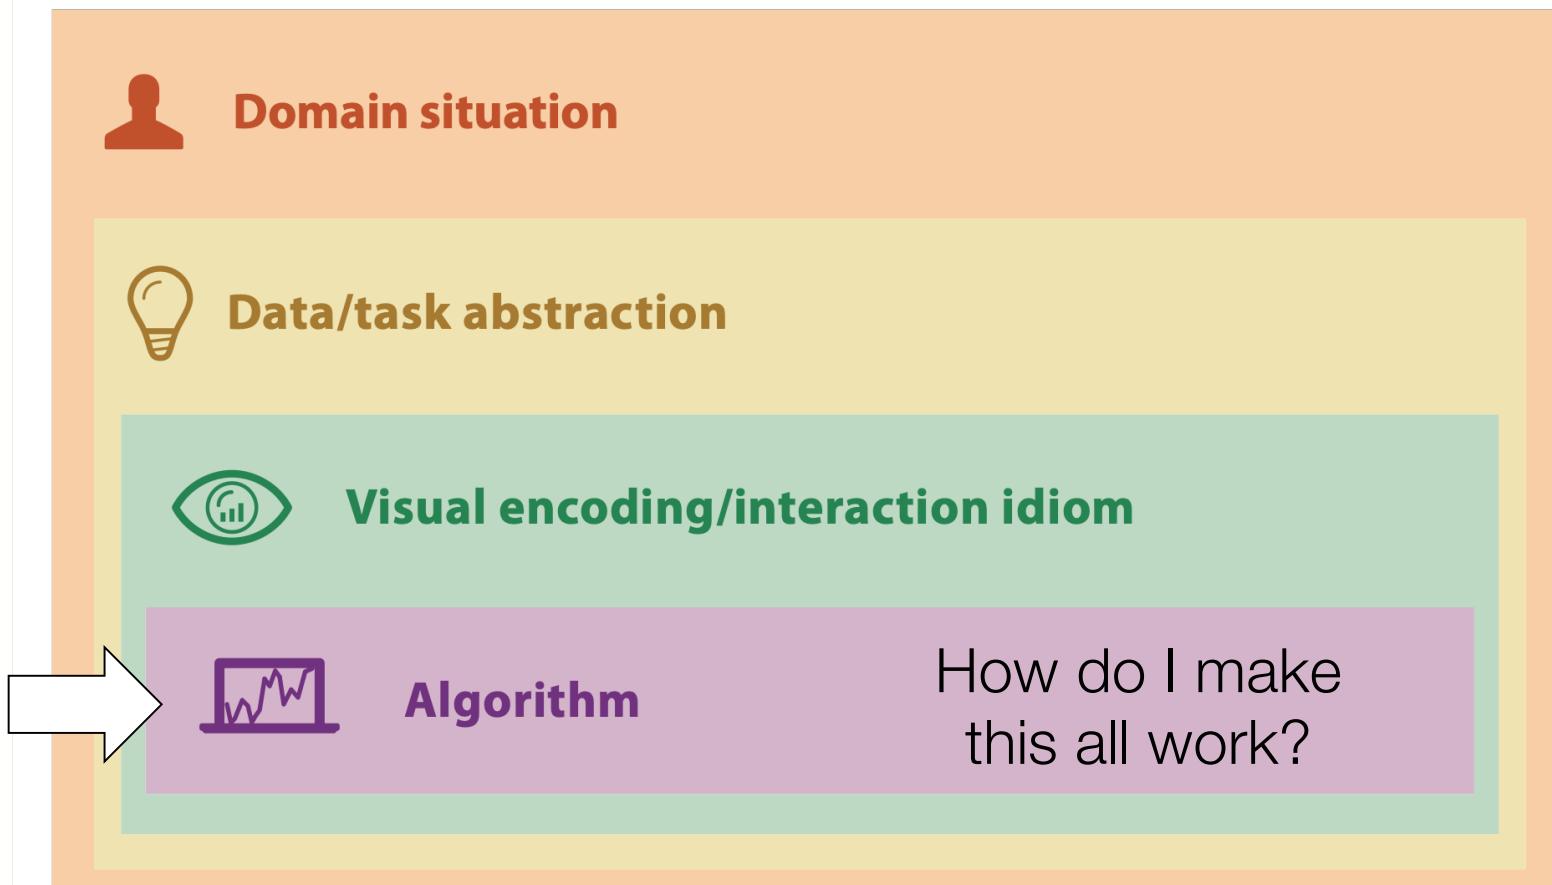

b) Abstracting data & tasks

c) Desining visual encoding & interaction

d) Creating algorithms

VIS design - What could go wrong?

Domain situation

You misunderstood their needs

Data/task abstraction

You're showing them the wrong thing

Visual encoding/interaction idiom

The way you show it doesn't work

Algorithm

Your code is too slow

Measures to validate VIS development

Domain situation

Observe target users using existing tools

Data/task abstraction

Visual encoding/interaction idiom

Justify design with respect to alternatives

Algorithm

Measure system time/memory

Analyze computational complexity

Analyze results qualitatively

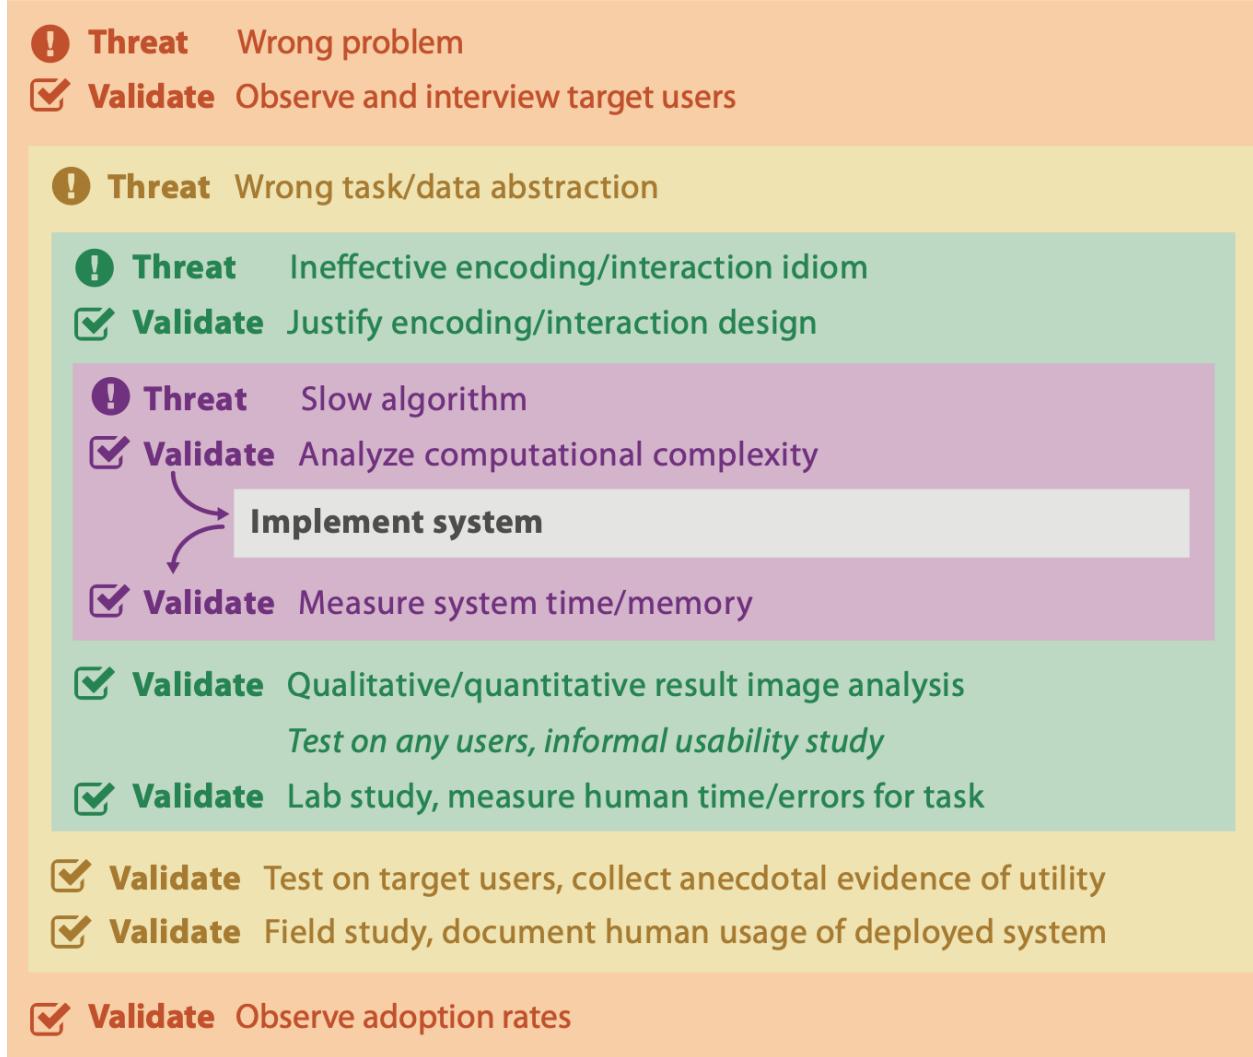

Measure human time with lab experiment (*lab study*)

Observe target users after deployment (*field study*)

Measure adoption

Design study methodology

(Sedlmair et al., 2012)

Design study definition

Design study papers explore the choices made when applying infovis techniques in an application area, for example relating the visual encodings and interaction techniques to the requirements of the target task. Although a limited amount of application domain background information can be useful to provide a framing context in which to discuss the specifics of the target task, the primary focus of the case study must be the infovis content. Describing new techniques and algorithms developed to solve the target problem will strengthen a design study paper, but the requirements for novelty are less stringent than in a Technique paper.

[Munzner, InfoVis03 CFP, infovis.org/infovis2003/CFP]

Design study definition

Design study papers **explore the choices made when applying infovis techniques in an application area**, for example relating the visual encodings and interaction techniques to the requirements of the target task. Although a limited amount of application domain background information can be useful to provide a framing context in which to discuss the specifics of the target task, the primary focus of the case study must be the infovis content. Describing new techniques and algorithms developed to solve the target problem will strengthen a design study paper, but the requirements for novelty are less stringent than in a Technique paper.

[Munzner, InfoVis03 CFP, infovis.org/infovis2003/CFP]

Design study methodology

(Sedlmair et al., 2012)

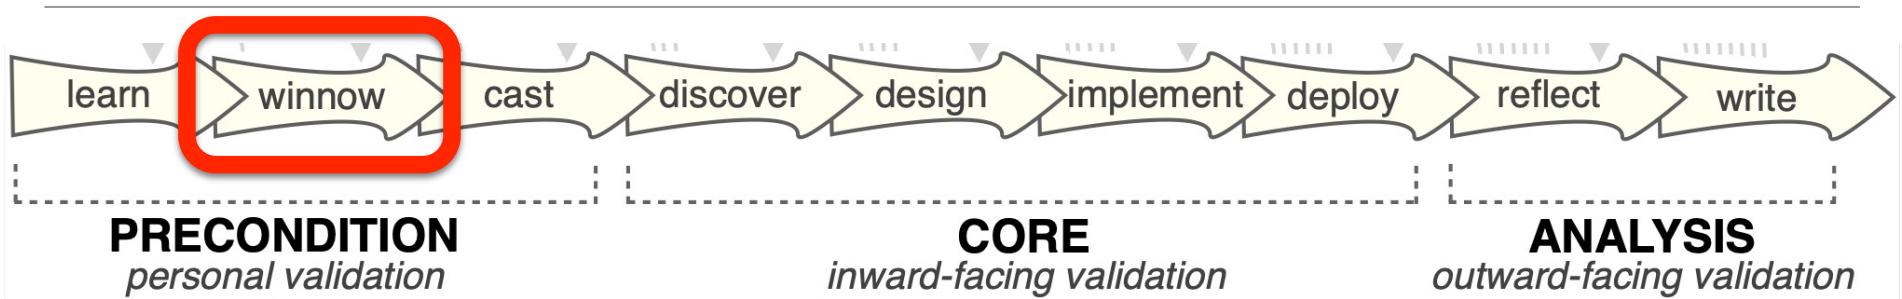

Design study methodology

What tools/techniques are available?

- Read vis papers
- Read vis books
- Talk to vis practitioners
- This course!

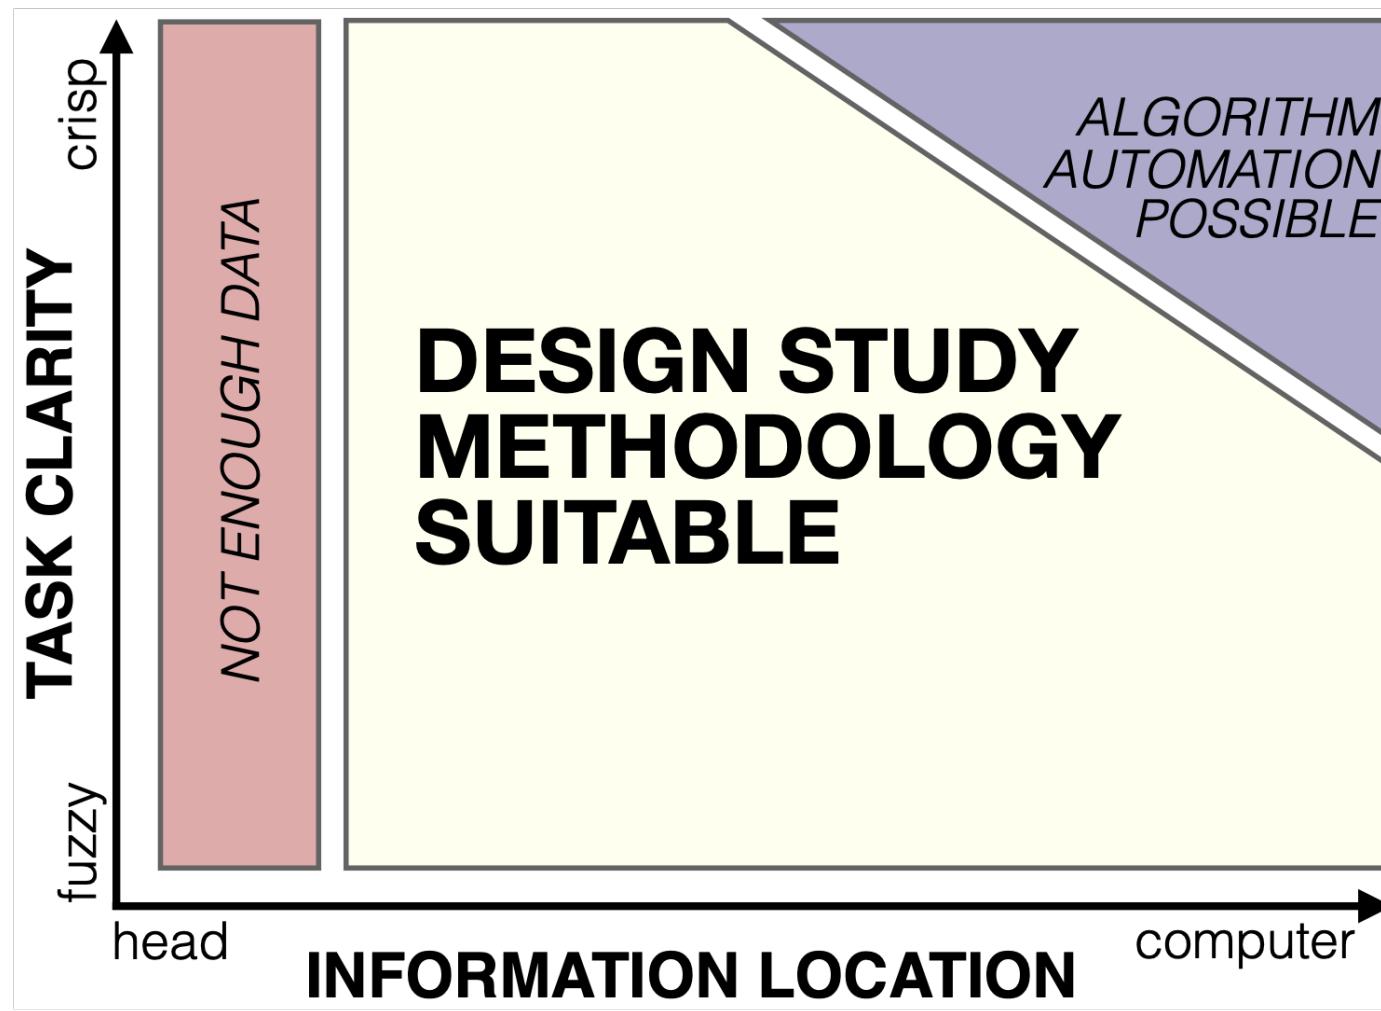

Design study methodology

Are these good collaborators?

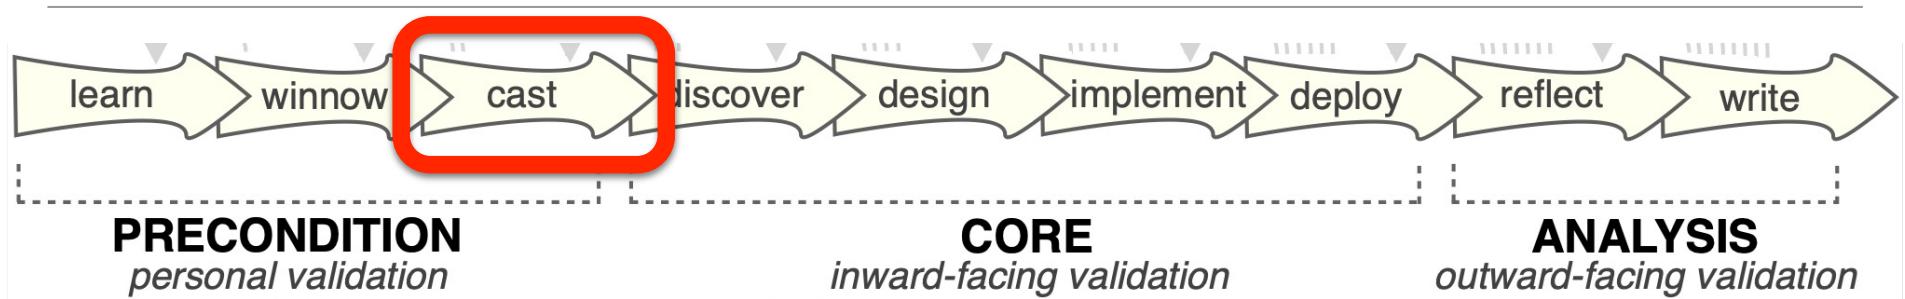

- Do they have interesting problems?
- Do they need novel solutions?
- Is there data?
- Can I work with these people?

When can you do a design study?

Sedlmair:2012

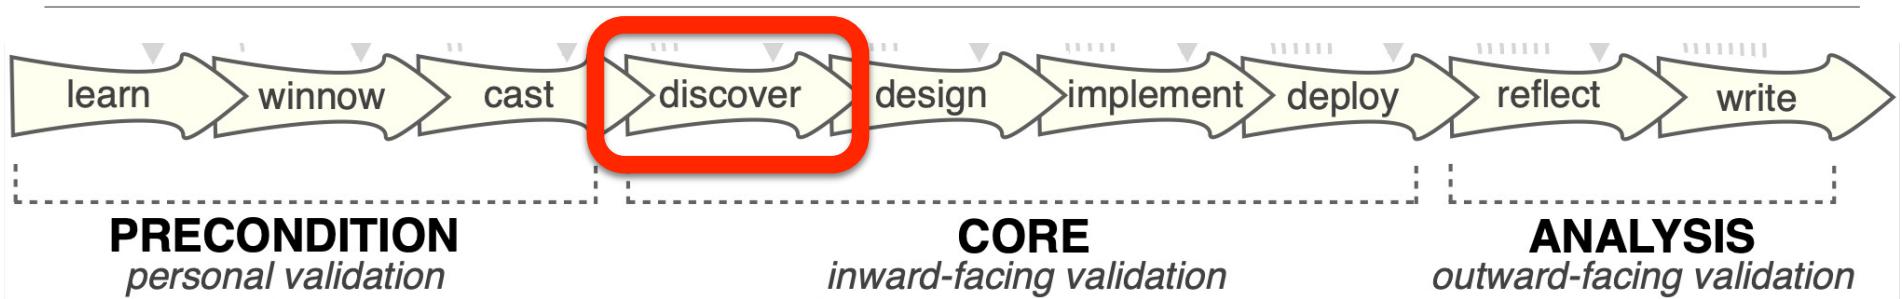

Design study methodology

Who's who?

- Do people have time for a new project?
- “Front-line analyst” is the domain expert
- Are there false “front-line analysts”?
- Do you need a “translator”?

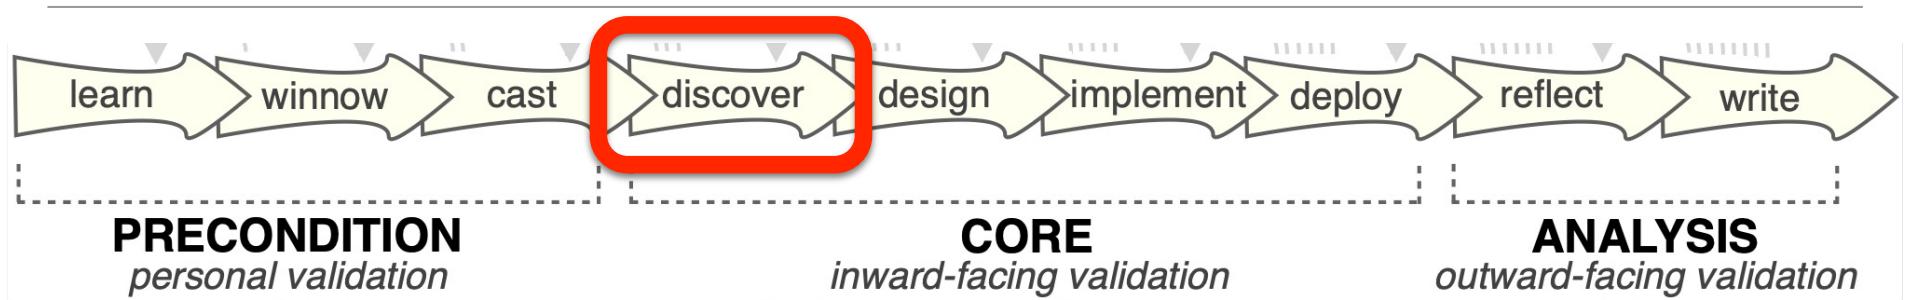

Design study methodology

Problem characterization and abstraction

- Requirements analysis
- Critical reflection on requirements!
- Abstraction is important for transferability
- Need some domain-expert knowledge

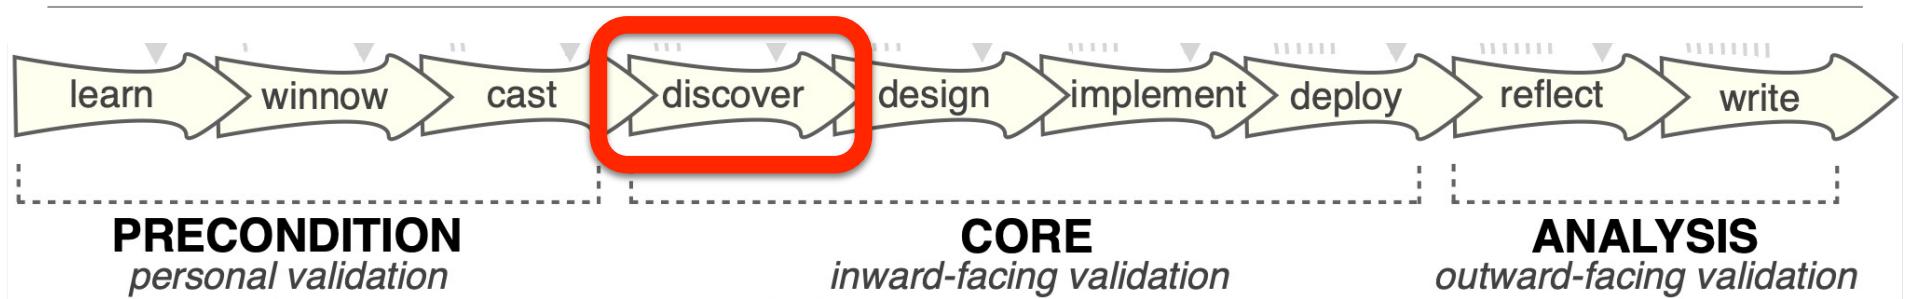

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- Overall goal: are there temporal patterns in power consumption?

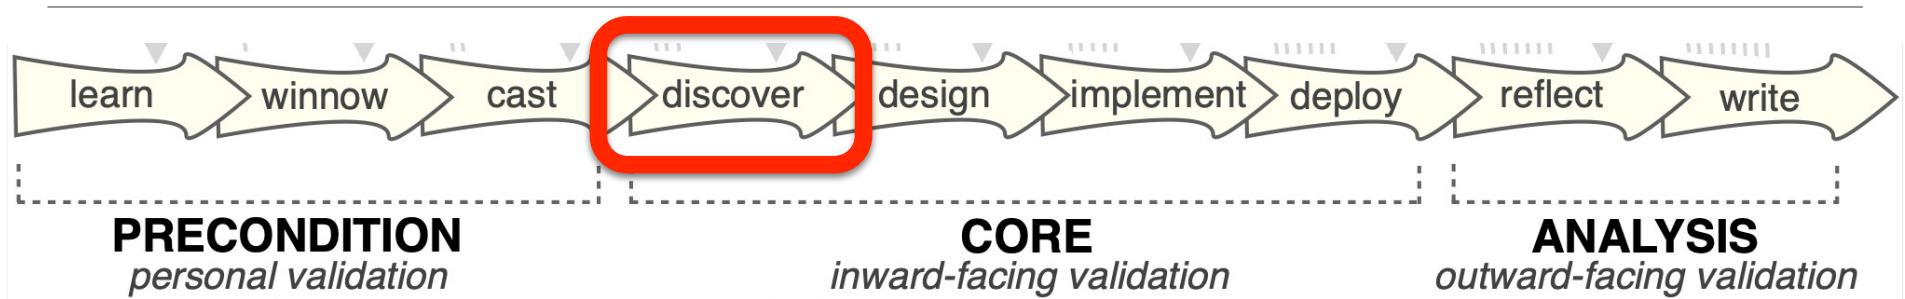

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- Data: ~50K pairs of (value, time)
- Tasks
 - Find standard day patterns
 - Find out how patterns are distributed over year, week, season
 - Find outliers from standard daily patterns
 - Want overview first, details on demand

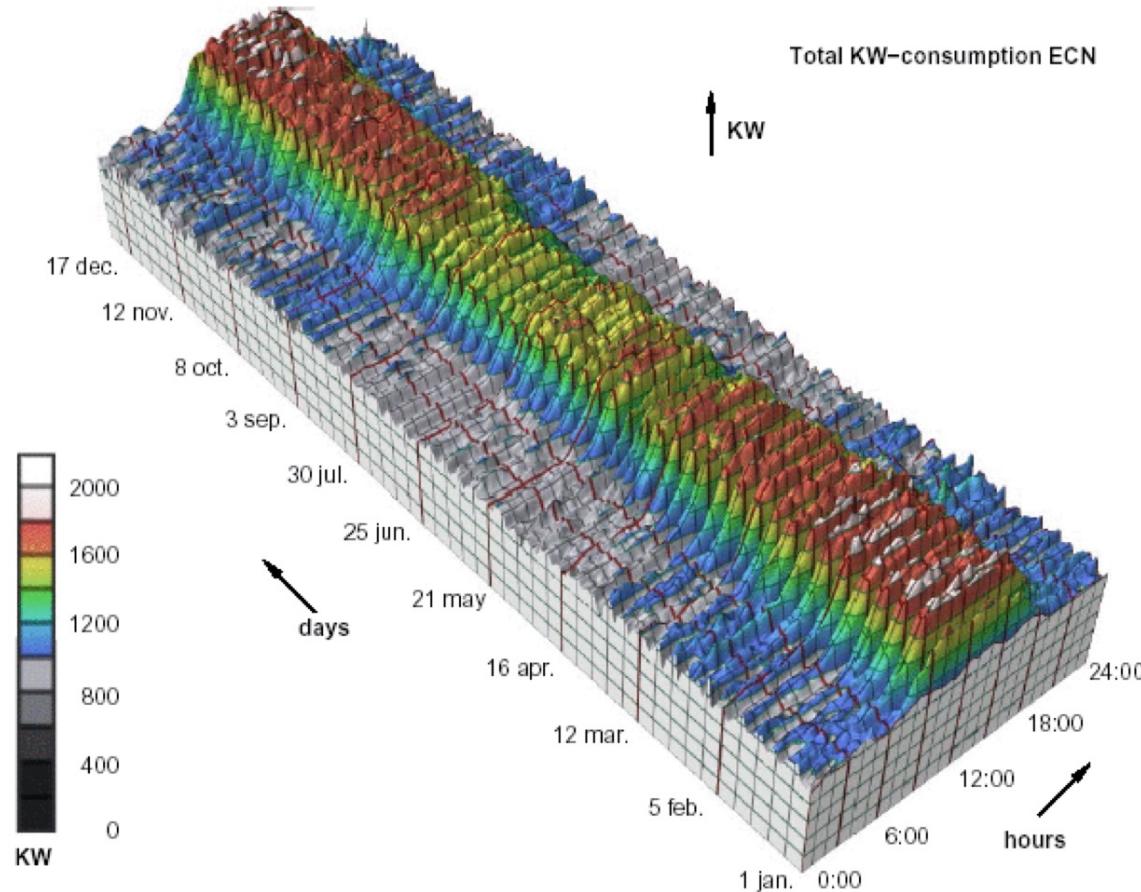

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

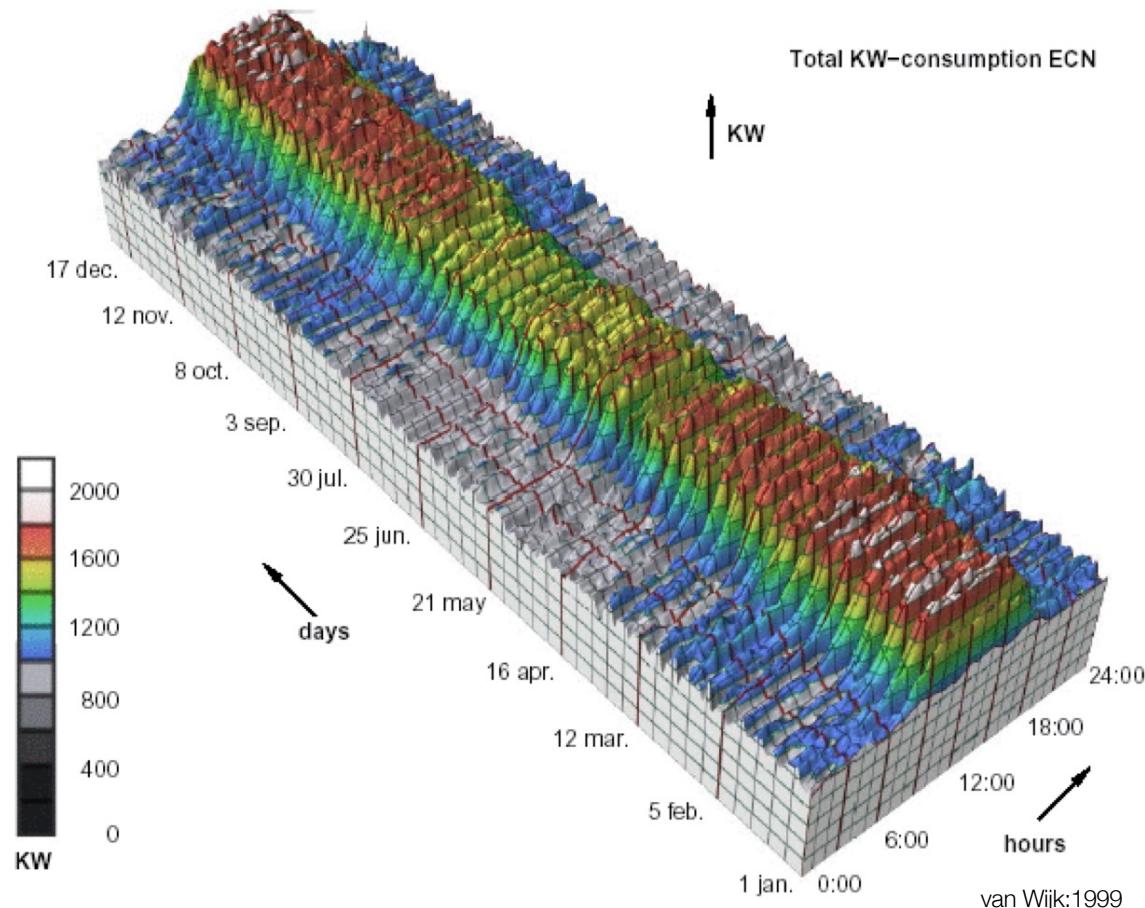

- Limitations of previous work:
 - predictive mathematical models: details lost
 - scale-space approaches (wavelet, fourier, fractal): hard to interpret, known scales lost
 - 3D mountain diagram (x: hours, y: value, z: days)

Design study methodology

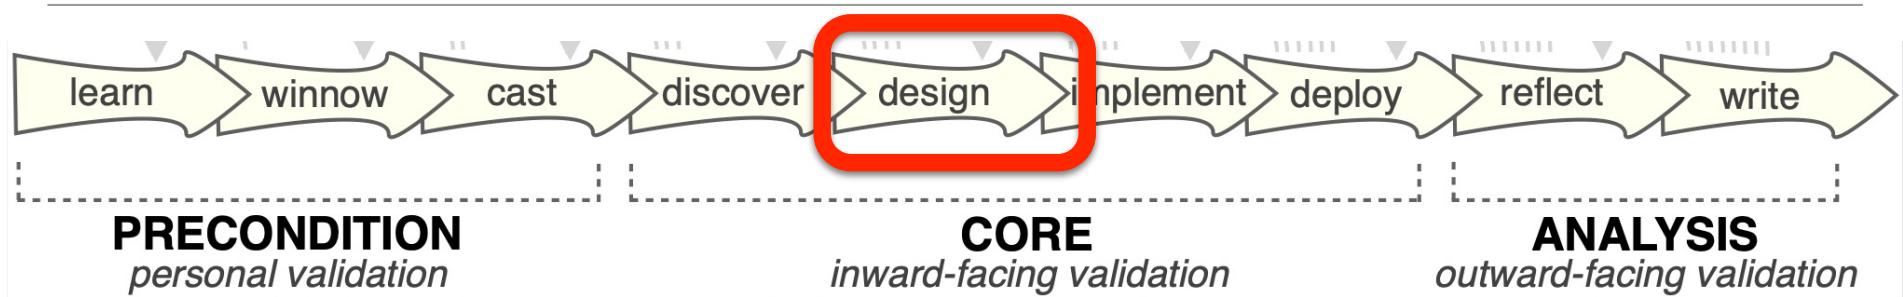

Design study methodology

- Pretty, not so useful
- Daily, weekly patterns are hard to see

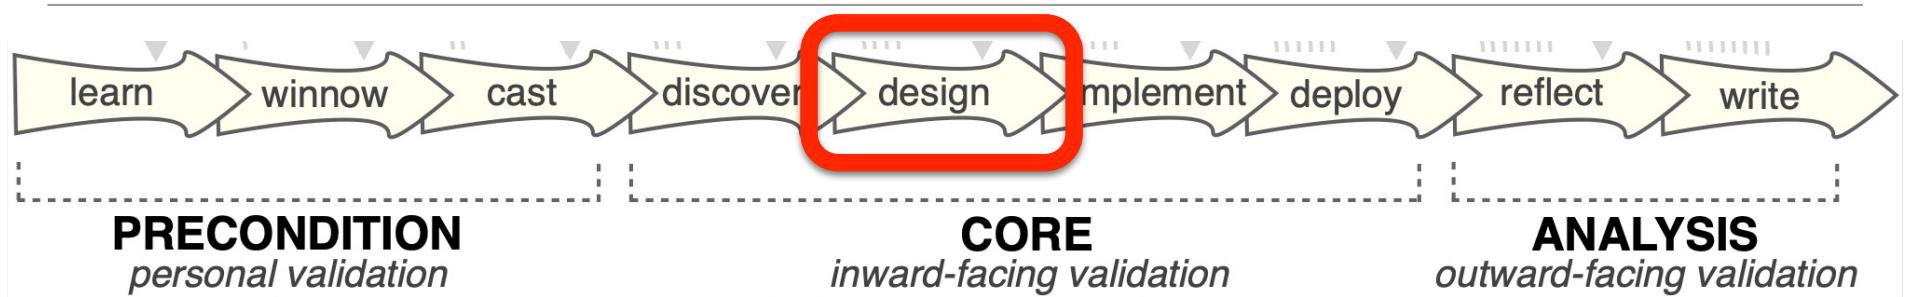

Design study methodology

Data abstraction, visual encoding, interaction

- What data transformations are needed?
- What visual designs to use?
- How to tie this together with interaction?
- Don't code!

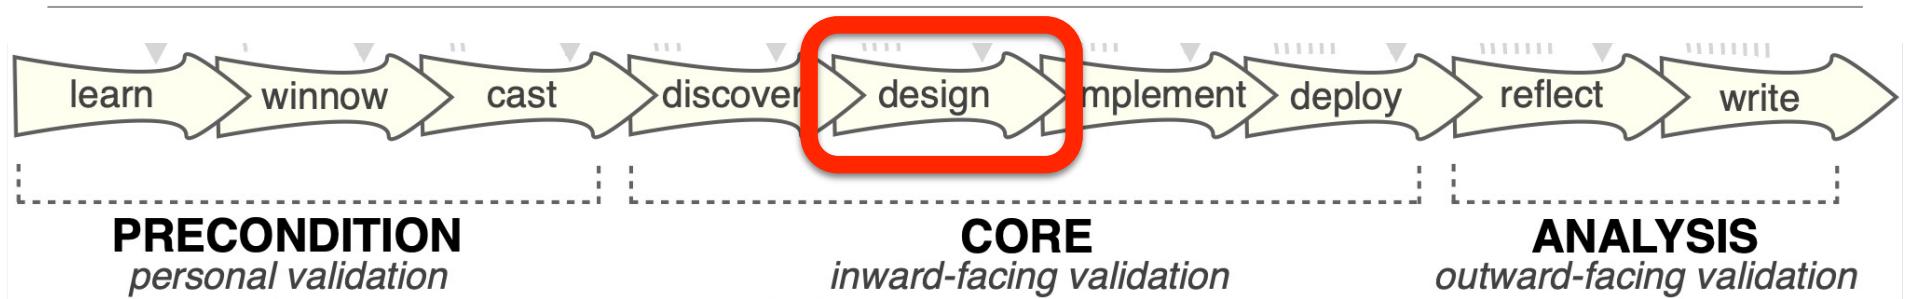

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- Data transform: hierarchical clustering

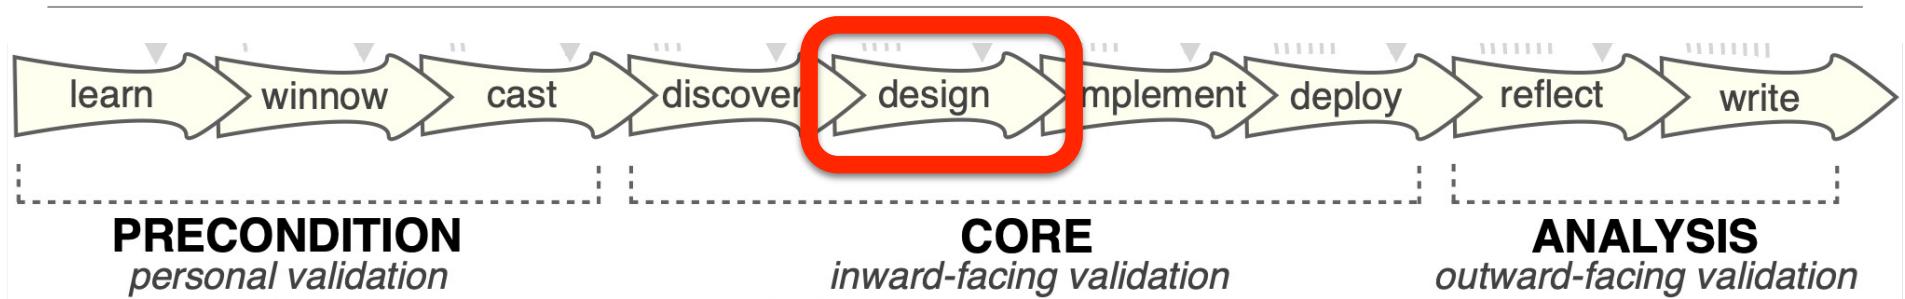

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- Data transform: hierarchical clustering
- start with M day patterns
 - compute pair-wise differences, merge most similar
 - now we have $M-1$ patterns
 - repeat until we have 1 root cluster
- result: binary hierarchy of clusters

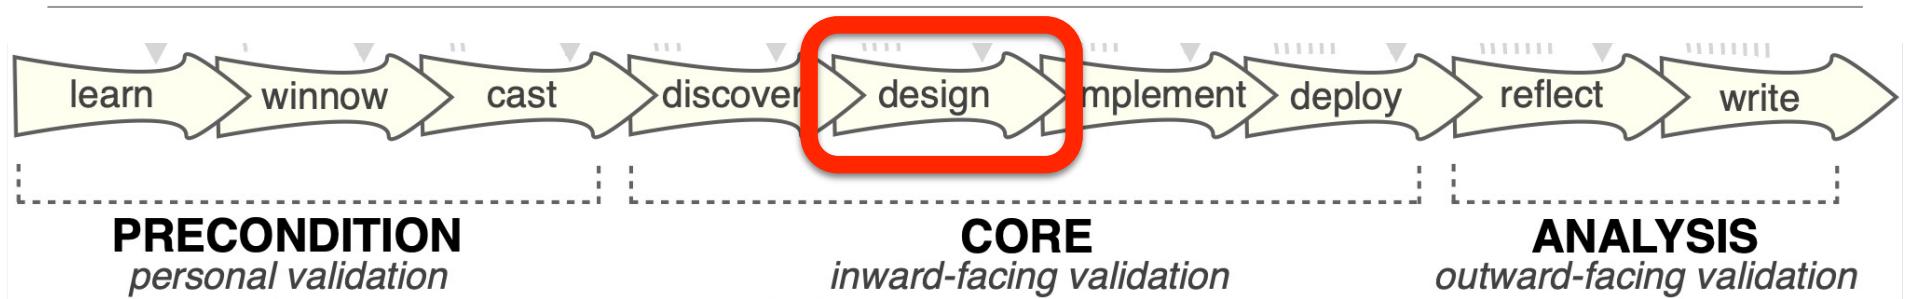

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- Data transform: hierarchical clustering
- issues:
 - distance metric to use?
 - how to display the cluster?

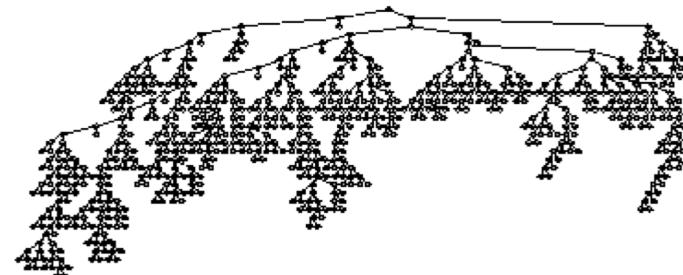

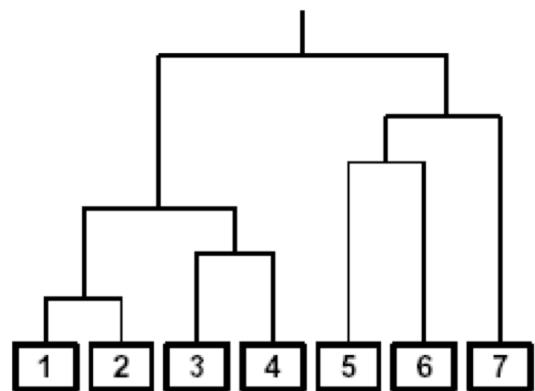

Design study methodology

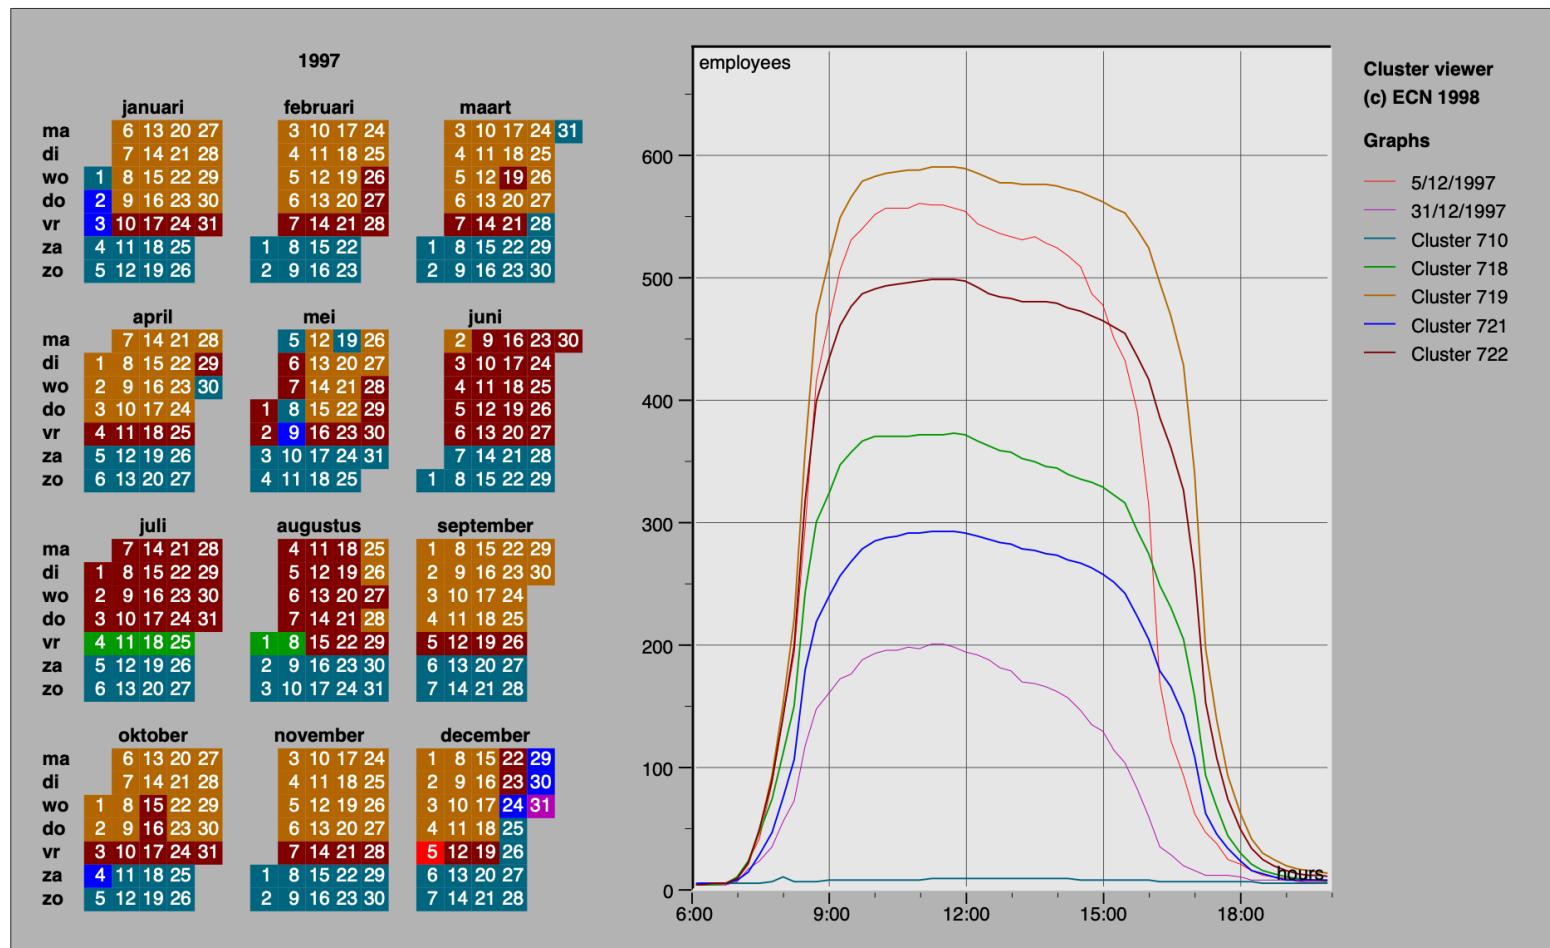

example: Cluster-Calendar, van Wijk and van Selow

- dendrogram

Shows hierarchical structure
but not time distribution!

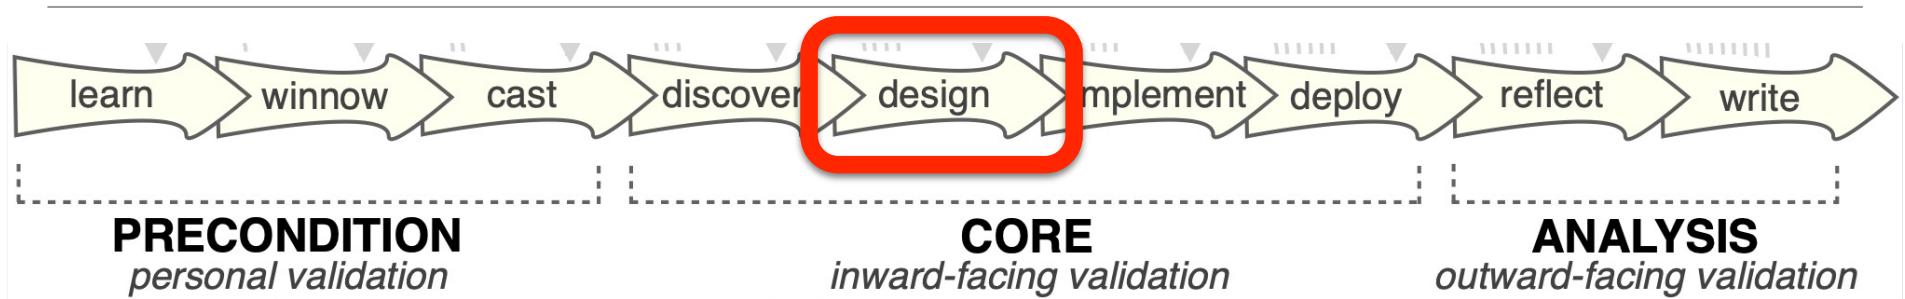

Design study methodology

Overview

Detail

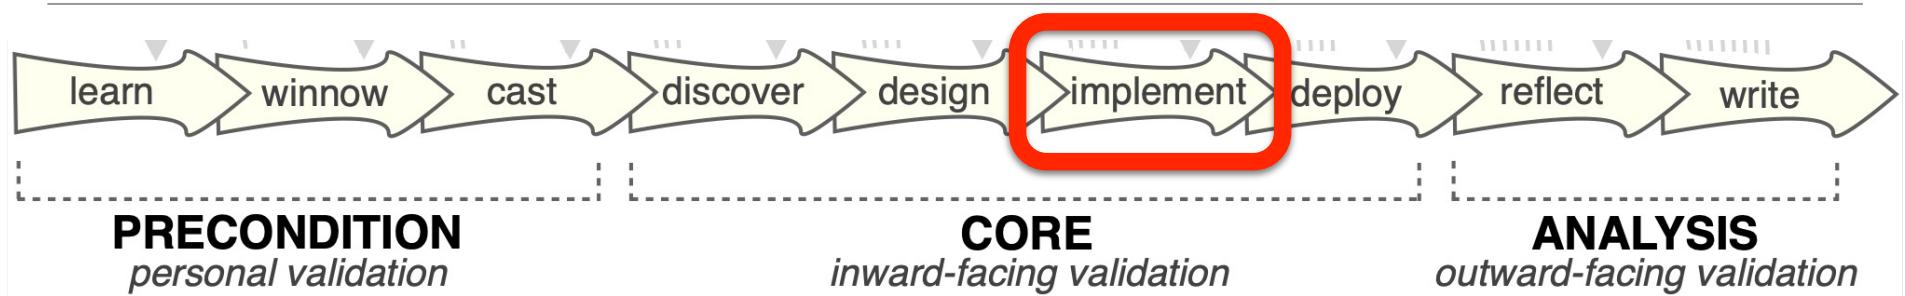

Design study methodology

example: Cluster-Calendar, van Wijk and van Selow

- clusters: data transformation to aggregate data
- calendar: familiar visual representation for time
- linking: interactive exploration of the data
- task analysis guided choices: 3D extrusion and dendrogram don't work

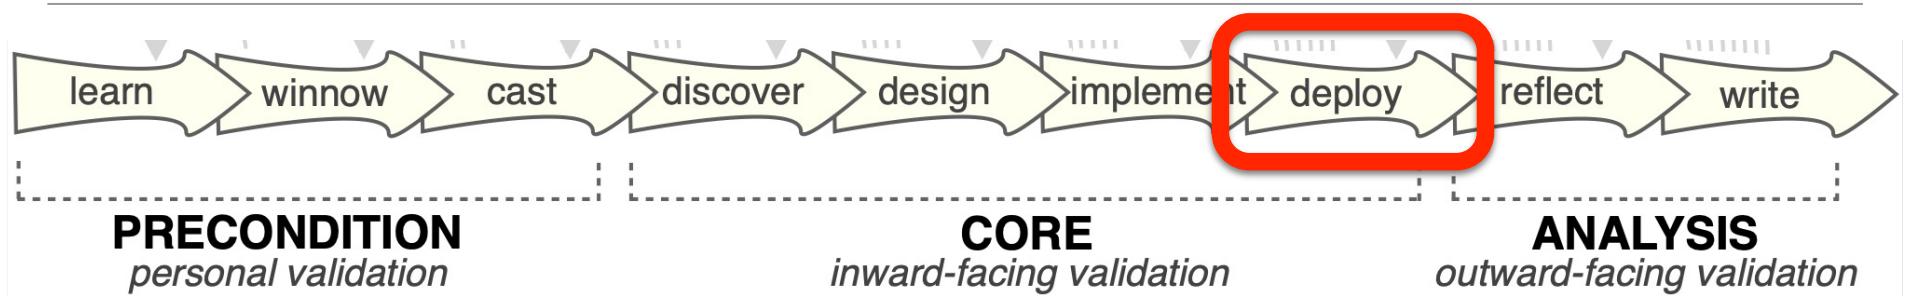

Design study methodology

Yay coding!

- Need to test design hypotheses
- Rapid prototyping (will probably throw away a lot of code)
- Breaking bugs vs annoying bugs
- Fast usability testing

Design study methodology

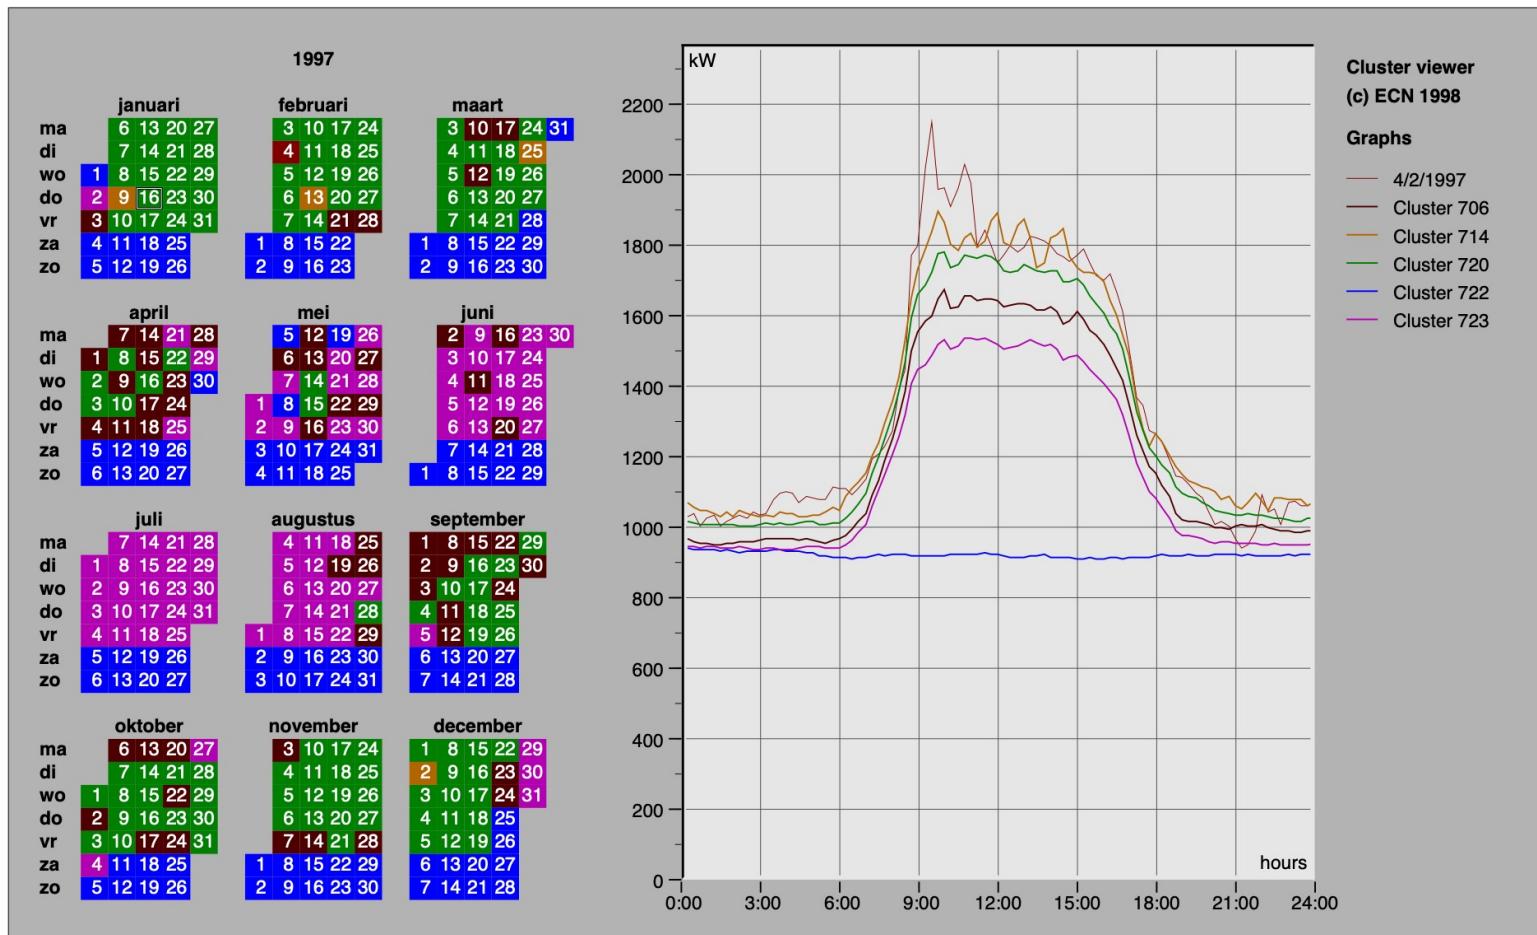

Hand-off to the users

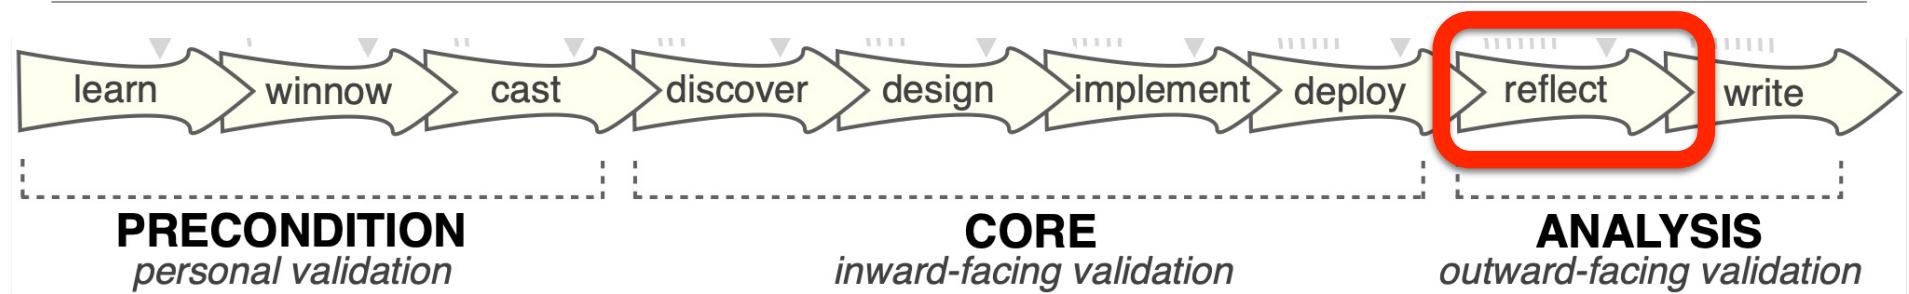

- Domain experts need to play with software
- What works, what doesn't?
- How to evaluate?
- May need to redesign/reimplement a lot

Design study methodology

Critique?

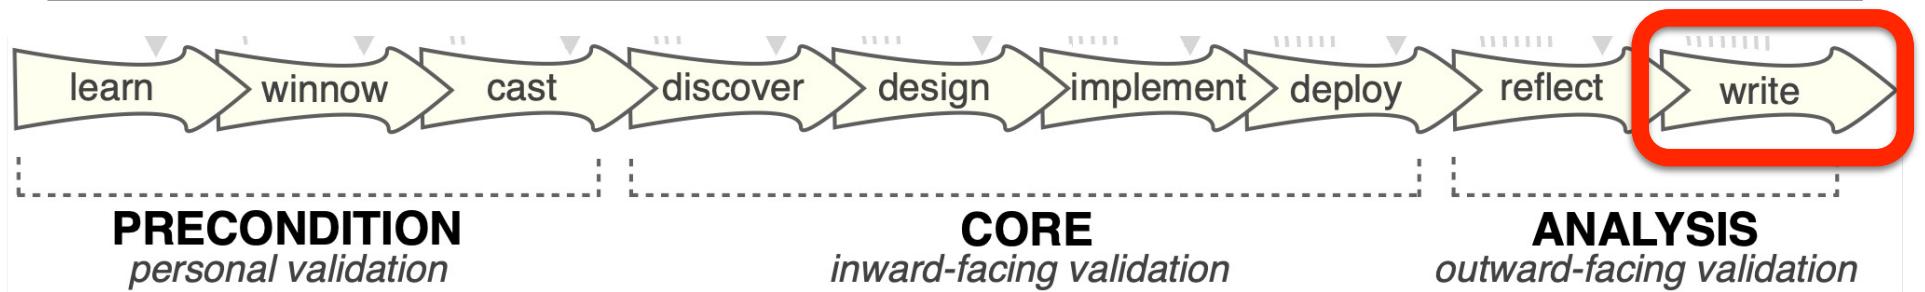

Design study methodology

Refine, reject, propose guidelines

- Compare to existing design guidelines
- Confirm which ones worked
- Reject which ones didn't work
- Come up with new guidelines

Design study methodology

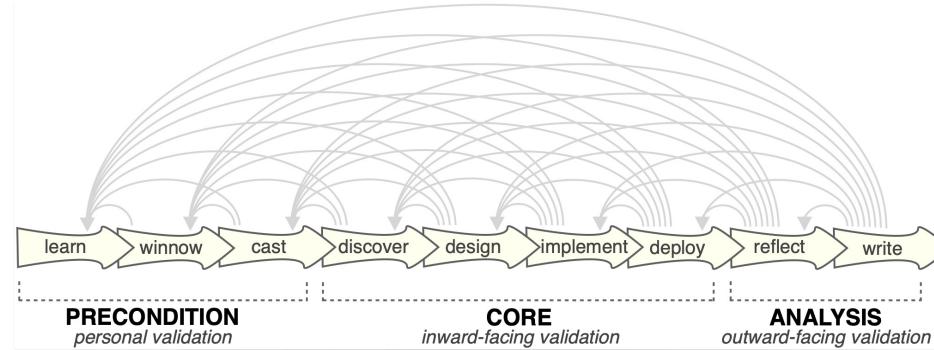

Yay words!

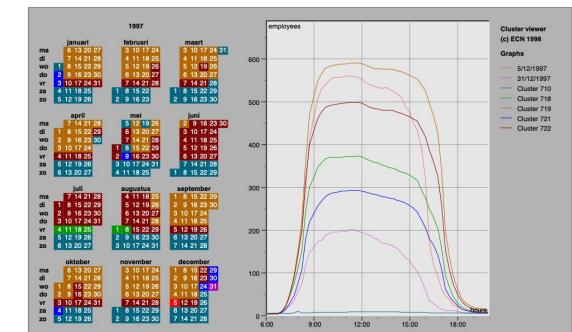

- Forces clear articulation of problem, tasks, solution
- Who else does my study help? - transferability!
- Think carefully about what readers will care about
- This takes time to do well!

Making the right tool

Questions
Data
Tasks

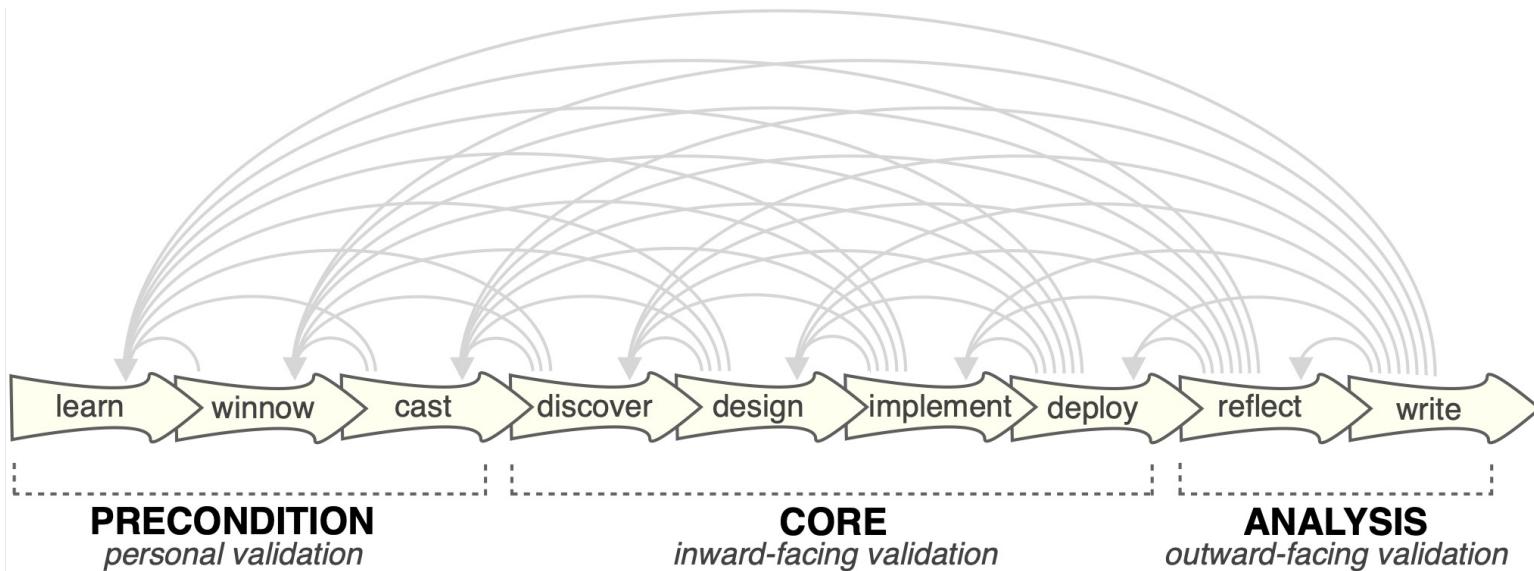

Design study methodology

van Wijk:1999

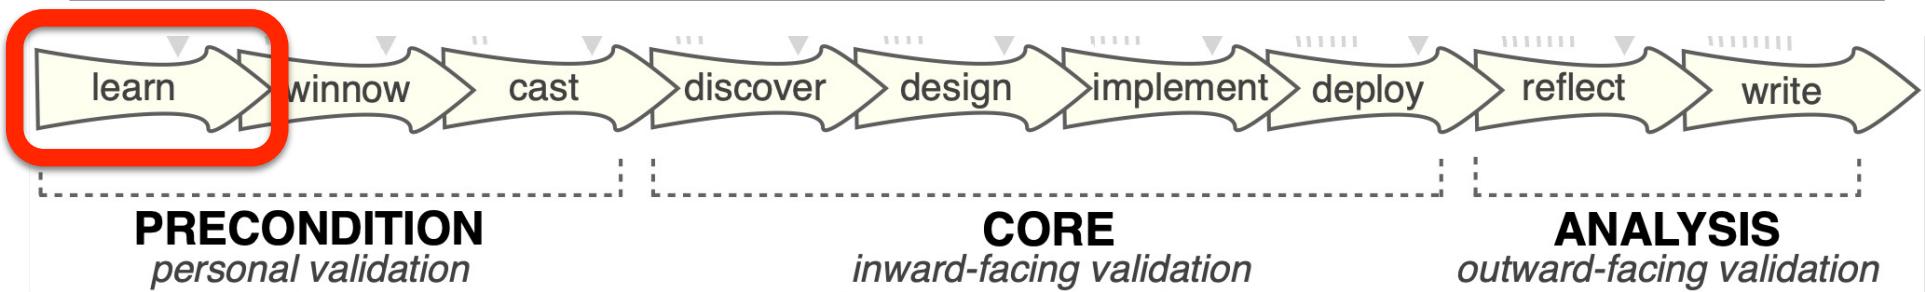

Pitfalls

Pitfalls

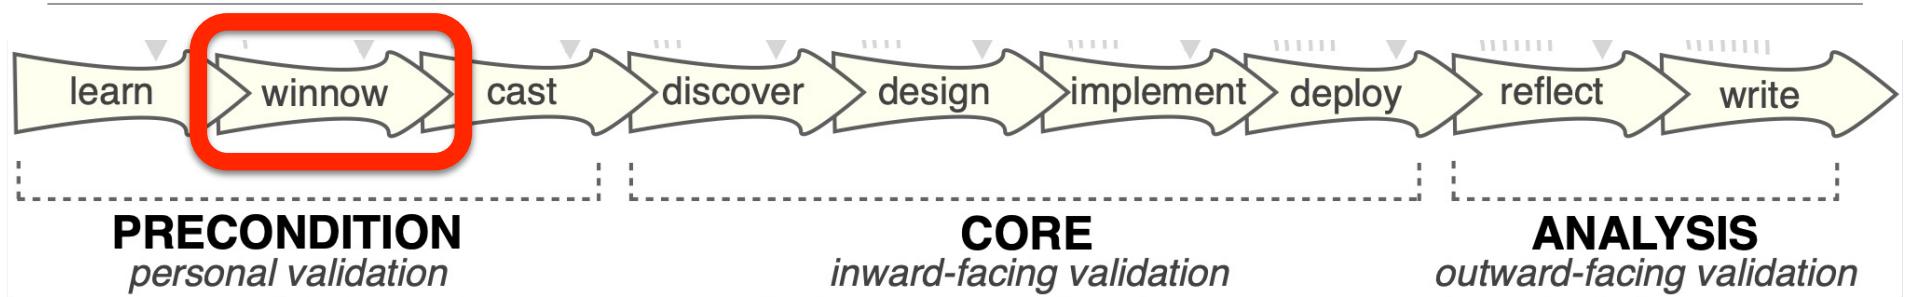

#1: Don't skip steps!

Pitfalls of learning & researching

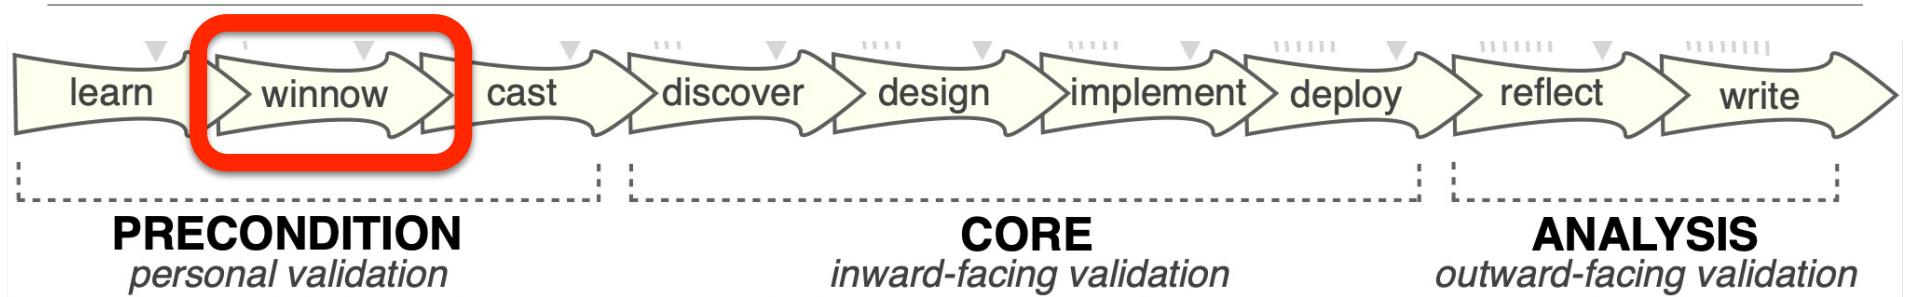

- insufficient knowledge of literature

Pitfalls of winnowing (I)

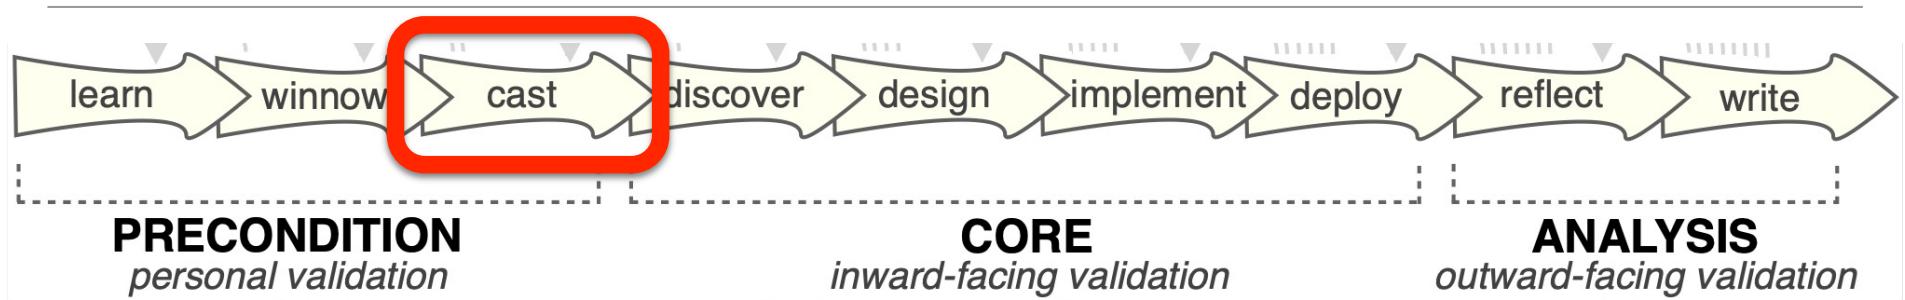

- collaboration with the wrong people
- **no real data available**
- insufficient time available from collaborators
- **no need for visualization: automate**
- no need for research: engineering project

Pitfalls of winnowing (II)

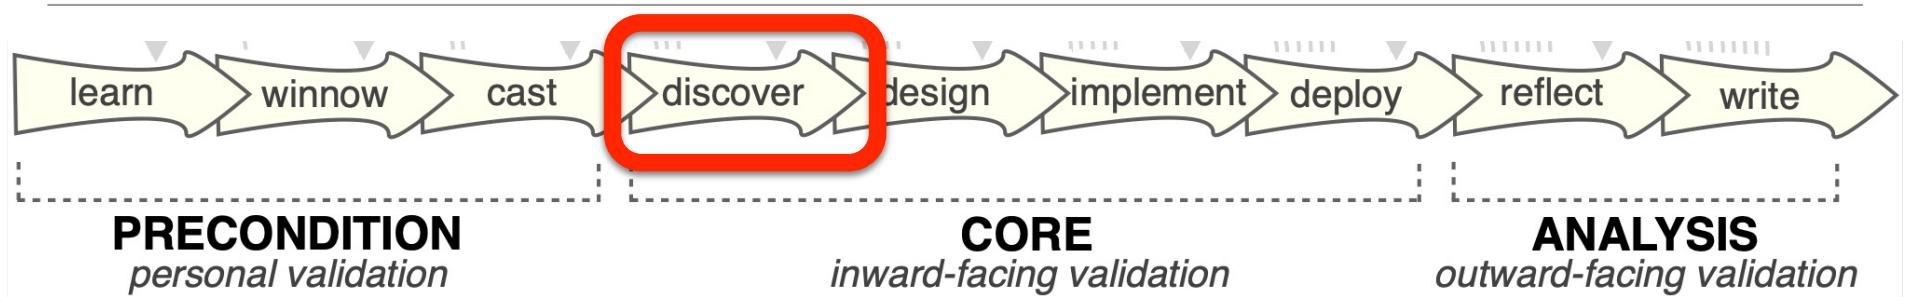

- **is this interesting to me?**
- existing tools are good enough
- **not an important/recurring task**
- no rapport with collaborators

Pitfalls of casting & enrolling

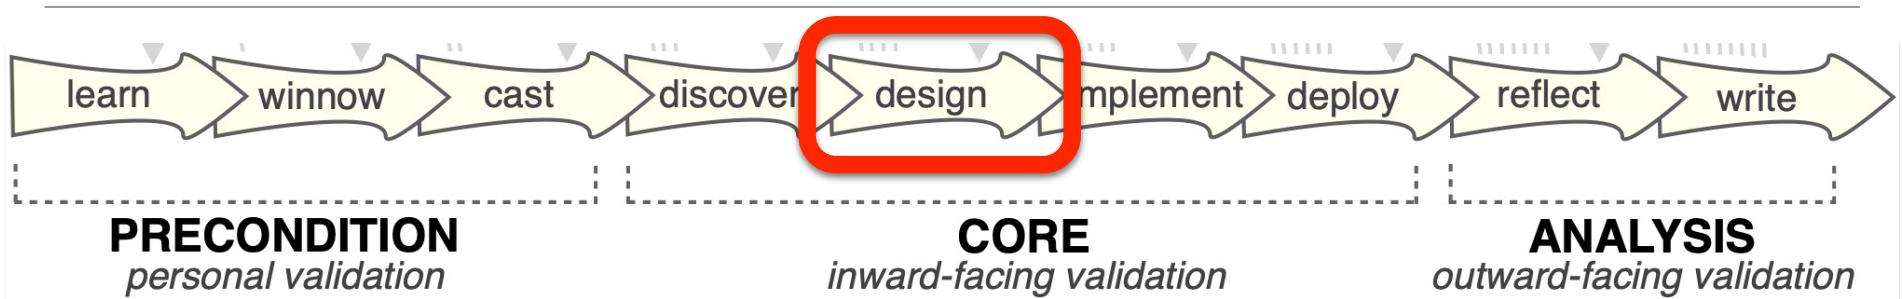

- not identifying front-line analyst and gatekeeper
- assuming same role distribution across projects
- mistaking tool-builders for real end users

Pitfalls of discovering

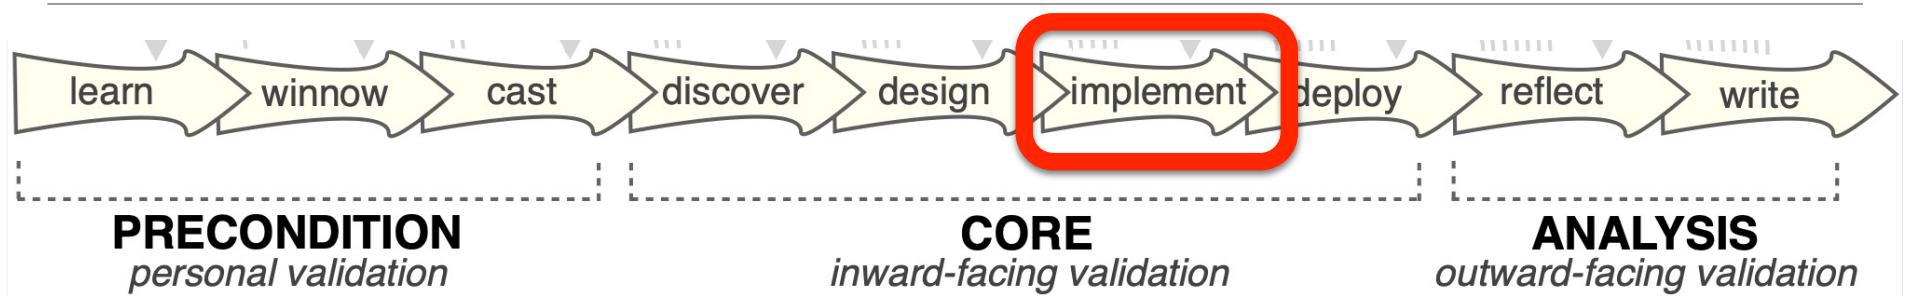

- ignoring practices that currently work well
- expecting *just talking* or *fly on the wall* to work
- domain experts design the visualizations
- too much/too little domain knowledge

Pitfalls of designing

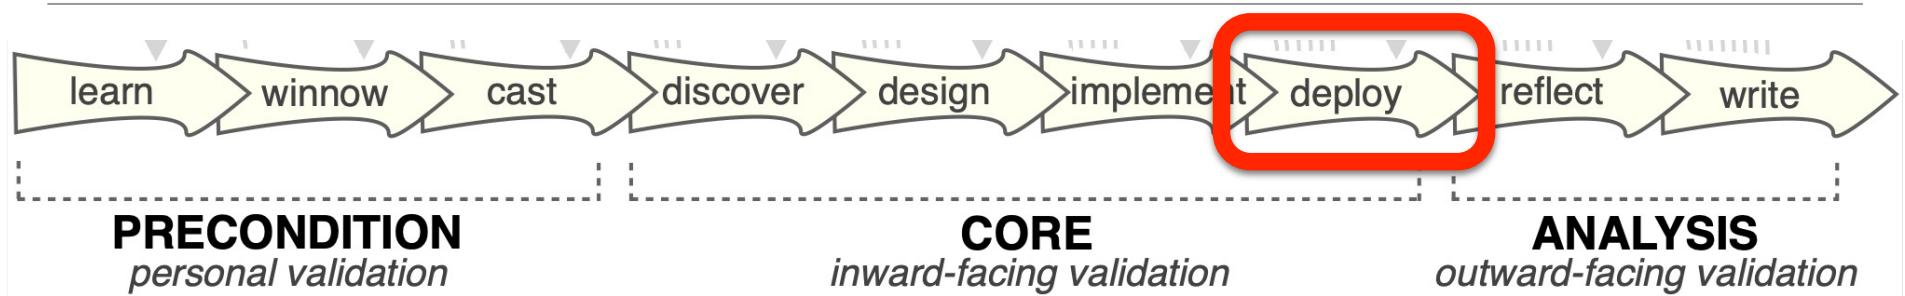

- too little abstraction
- **design consideration space too small**
- mistaking technique-driven and problem-driven work

Pitfalls of implementing

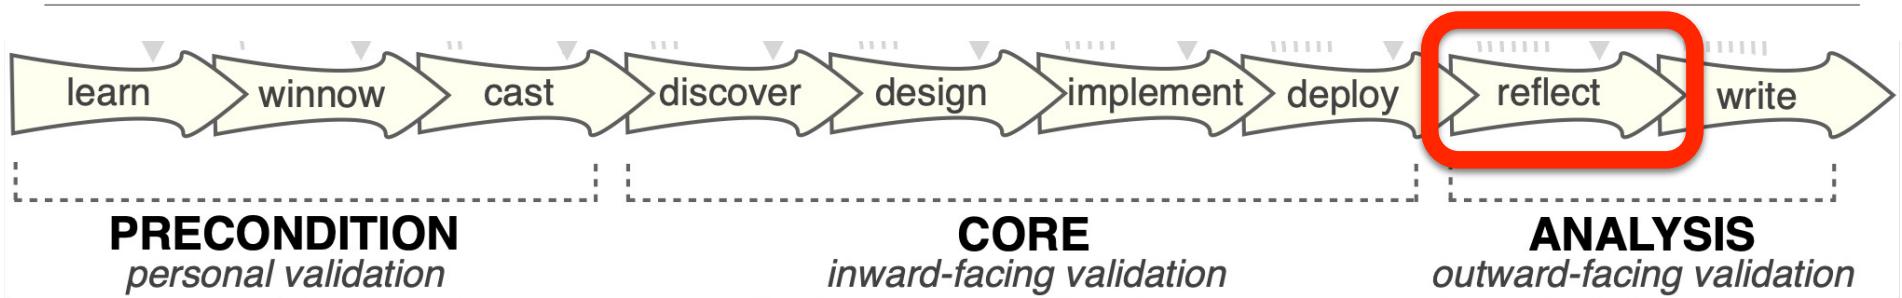

- non-rapid prototyping
- usability: too little / too much

Pitfalls of deploying

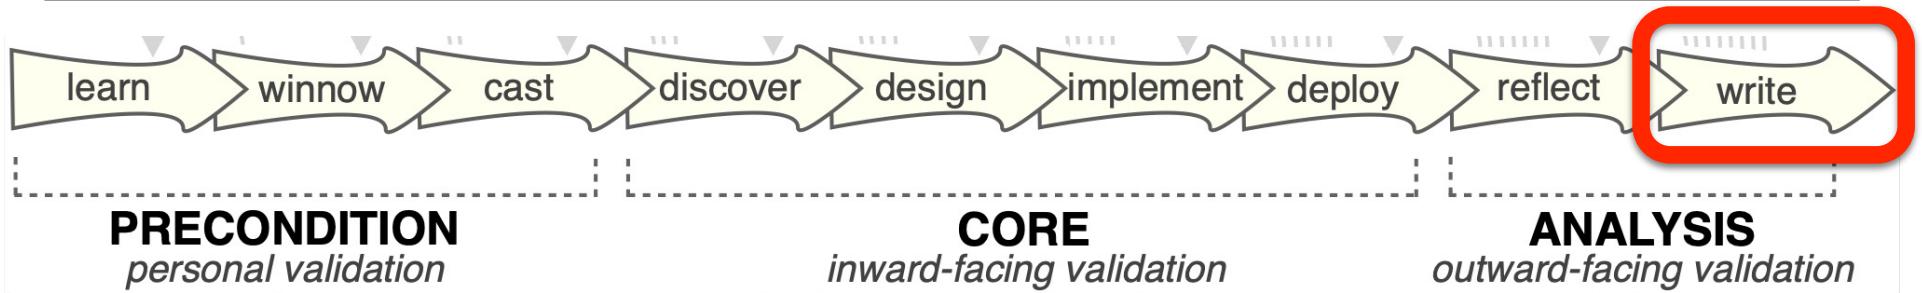

- **insufficient deploy time**
 - non-real task / data / user
 - *liking* a tool is not validation!

Pitfalls of reflecting

- failing to improve guidelines

Pitfalls of writing

- **not enough writing time**
- no technique contribution ≠ write a design study
- too much domain background
- chronological story vs concentrating on results
- **premature end to the project**
